

[admin](#) - Thu, 2/13/2014 - 13:20

This is the mortality table for computing deductions for split interest gifts that was in effect from 12/1/83 through 4/30/1989. The left column is the age of the population and the right column is the number of survivors per 100,000 population.

The table shows the number of survivors at each age out of a population of 100,000 at age 0.

**Age Survivors Age Survivors Age Survivors**

0	100000	38	93843	76	46946
1	97998	39	93593	77	44101
2	97876	40	93322	78	41192
3	97792	41	93028	79	38245
4	97724	42	92712	80	35285
5	97668	43	92368	81	32323
6	97619	44	91995	82	29375
7	97573	45	91587	83	26469
8	97531	46	91144	84	23638
